

# NCP630

## Linear Voltage Regulators - Fast

### 3.0 A

The NCP630 is a low dropout positive voltage regulator that is capable of providing a guaranteed output current of 3.0 A with a maximum dropout voltage of 1.25 V at 3.0 A over temperature. The fast turn on time allows step changes in loads commonly found in low voltage microprocessor applications. The NCP630 is currently offered as an adjustable output version that can be programmed down to 1.2 V with two external resistors and as a fixed output version at 3.47 V. On chip trimming adjusts the reference/output voltage to within  $\pm 1.5\%$  accuracy. Internal protection features consist of output current limiting and thermal shutdown. NCP630 is available in D<sup>2</sup>PAK package.

#### Features

- Output Current of 3.0 A
- 1.25 V Maximum Dropout Voltage at 3.0 A Over Temperature
- Voltage on Shutdown Pin is TTL Compatible
- Reference/Output Voltage Trimmed to  $\pm 1.5\%$
- Current Limit Protection
- Thermal Shutdown Protection
- $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  Junction Temperature Range
- Pb-Free Packages are Available

#### Applications

- Microprocessor Power Supplies
- DSP Power Supplies
- SMPS Post Regulation
- Battery Chargers

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

- This device series contains ESD protection and exceeds the following tests:  
Human Body Model JESD 22-A114-B  
Machine Model JESD 22-A115-A
- The maximum package power dissipation is:

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

## PIN FUNCTION DESCRIPTION

| Pin No. | NCP630A   | NCP630G   | Description                                                                                                                                                                                                                                                       |
|---------|-----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1       | Shutdown  | Shutdown  | This input is used to place the NCP630 into shutdown mode. The NCP630 is active when a voltage greater than 2.0 V is applied. The NCP630 will be placed into a shutdown mode when a voltage less than 0.8 V is applied. If left unused then connect the pin high. |
| 2       | $V_{in}$  | $V_{in}$  | Positive power supply input voltage                                                                                                                                                                                                                               |

- Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.
- Line regulation is defined as the change in output voltage for a change in input voltage. Load regulation is defined as the change in output voltage for a change in output load current at a constant temperature. The limits for line and load regulation are contained within the reference voltage specification,  $V_{adj}$ . Typical numbers are included in the specification for line and load regulation.
- The short circuit limit is for device protection. Maximum output current is guaranteed to be greater or equal to 3.0 A with a 6.0 A typical as listed in the peak output limit specification.

## APPLICATION INFORMATION

**Input Capacitor**

The minimum capacitance required for stability is a 68  $\mu\text{F}$  aluminum electrolytic or tantalum capacitor. The maximum ESR allowed for stability is 5.0  $\Omega$ . The capacitor should be placed as close as possible to the input of the device.

The placement of a ceramic capacitor in parallel is not recommended due to possible instabilities.

**Output Capacitor**

A minimum output capacitor value of 33  $\mu\text{F}$  is required for stability. The type of capacitor can be aluminum electrolytic or tantalum capacitor. ESR can vary up to a maximum of 2.0 ohms for stability. The capacitor should be placed as close as possible to the output of the device.

The placement of a ceramic capacitor in parallel is not recommended due to possible instabilities.

**Sense Pin**

The sense pin of the NCP630G will need to be connected near the output voltage. This provides great advantages when the linear regulator can't be near the load. The sense pin will monitor the load and allow the linear regulator to adjust for losses in the line between itself and the load. Thus it will provide good accuracy for a remote load.

**ADJ Pin**

The typical application circuits for the fixed and adjustable output regulators are shown in Figures 1 and 2. The adjustable devices develop and maintain the nominal 1.216 V reference voltage between the adjust and ground pins. The adjust pin current,  $I_{\text{adj}}$ , is typically 40 nA and normally lower than the current flowing through R1 and R2, thus it generates a small output voltage error that can usually be ignored. For the fixed output devices R1 and R2 are included within the device.

**Reverse Current**

Some situations might occur where the output pin is raised to a voltage while the input pin is at zero volts. This situation will not damage the device.

If the output voltage is raised to a higher voltage than the input voltage a diode is recommended from output to input with the anode connect to the output pin.

**Thermal Considerations**

This series contains an internal thermal limiting circuit that is designed to protect the regulator in the event that the maximum junction temperature is exceeded. When activated, typically at 165°C, the regulator output switches off and then back on as the die cools. As a result, if the device is continuously operated in an overheated condition, the output will appear to be oscillating. This feature provides protection from a catastrophic device failure due to accidental overheating. It is not intended to be used as a substitute for proper heatsinking. The maximum device power dissipation can be calculated by:

$$P_D = \frac{T_{J(\text{max})} - T_A}{R_{\theta JA}}$$

The devices are available in surface mount D<sup>2</sup>PAK package. The package has an exposed metal tab that is specifically designed to reduce the junction to air thermal resistance,  $R_{\theta JA}$ , by utilizing the printed circuit board copper as a heat dissipater. Figure 11 shows typical  $R_{\theta JA}$  values that can be obtained from a square pattern using economical single sided 2.0 ounce copper board material. The final product thermal limits should be tested and quantified in order to insure acceptable performance and reliability. The actual  $R_{\theta JA}$  can vary considerably from the graphs shown. This will be due to any changes made in the copper aspect ratio of the final layout, adjacent heat sources, and air flow.

**Figure 11. 3-Pin and 5-Pin D<sup>2</sup>PAK  
Thermal Resistance and Maximum Power  
Dissipation versus P.C.B. Copper Length**

# NCP630

## TAPE AND REEL SPECIFICATION

| SOP Description    | Leads | Package Length | Package Width | Package Thickness | Reel Quantity | Tape Pitch | Tape Width | Vendor P/N |
|--------------------|-------|----------------|---------------|-------------------|---------------|------------|------------|------------|
| D <sup>2</sup> PAK | 5     | 9.2 mm         | 10 mm         | 4.4 mm            | 800           | 16 mm      | 24 mm      | DDPAK-B    |

NOTES:

1.  $A_0$  &  $B_0$  MEASURED AT 0.3 mm ABOVE BASE OF POCKET
2. 10 PITCHES CUMULATIVE TOTAL  $\pm 0.2$  mm

## PACKAGE DIMENSIONS

ON Semiconductor®

### D<sup>2</sup>PAK 5-LEAD CASE 936A-02 ISSUE E

DATE 28 JUL 2021

SCALE 1:1

#### NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: INCHES
3. TAB CONTOUR OPTIONAL WITHIN DIMENSIONS A AND K.
4. DIMENSIONS U AND V ESTABLISH A MINIMUM MOUNTING SURFACE FOR TERMINAL 4.
5. DIMENSIONS A AND B DO NOT INCLUDE MOLD FLASH OR GATE PROTRUSIONS. MOLD FLASH AND GATE PROTRUSIONS NOT TO EXCEED 0.025 (0.635) MAXIMUM.

#### GENERIC MARKING DIAGRAM\*

XXXXXX = Device Code  
A = Assembly Location  
WL = Wafer Lot  
Y = Year  
WW = Work Week  
G = Pb-Free Package

\*This information is generic. Please refer to device data sheet for actual part marking. Pb-Free indicator, "G" or microdot "•", may or may not be present. Some products may not follow the Generic Marking.

#### RECOMMENDED MOUNTING FOOTPRINT \*

\* For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.
